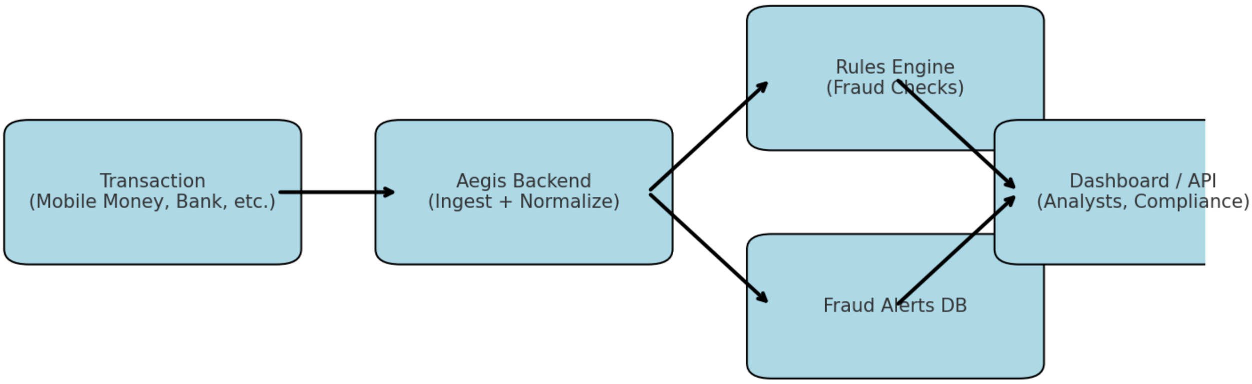
Aegis Fraud Detection — Non-Technical Overview

This document gives a clear, non-technical view of how Aegis works for detecting and preventing fraudulent financial transactions.

System Flow Diagram



1. Everyday Scenario

Imagine a mobile money operator like M-Pesa or Airtel Money. Every second, thousands of transactions happen. Most are legitimate. But some may be fraudulent: stolen SIM cards, unusually large amounts, or suspicious accounts.

2. How Aegis Works

- Transaction arrives ■ — A new payment enters the system and Aegis immediately records it.
- Quick screening ■■ — In less than a second, Aegis runs checks: is the payment too large? too frequent? from a suspicious account?
- Alert raised ■ — If something looks suspicious, Aegis creates an alert.
- Analyst review ■■■ — Compliance teams log into the dashboard to review alerts and resolve them.

3. Real-World Benefits

- Fast response — suspicious payments caught in seconds.
- Reduced losses — prevent fraud before money leaves the system.
- Audit trail — every alert and action is recorded for compliance.
- Scalable — handles thousands of transactions per second.

4. Executive Summary

“When a suspicious transaction happens, Aegis will immediately flag it and notify your compliance team. Instead of finding out days later, you’ll know within seconds, and your team can act before money is lost.”
