

Aegis Fraud Detection — Non-Technical Overview

1. Everyday Scenario

Imagine a mobile money operator like M-Pesa or Airtel Money. Every second, thousands of transactions happen: customers paying merchants, sending money to friends, buying goods online. Most are legitimate. But some may be fraudulent: a stolen SIM card making many payments, someone moving unusually large amounts, or a known fraudster sending money to new accounts.

2. How Aegis Works

- Transaction arrives ■ — A new payment enters the system and Aegis immediately records it.
- Quick screening ■■ — In less than a second, Aegis runs checks: Is the payment too large? Too frequent? From a suspicious account?
- Alert raised ■ — If something looks suspicious, Aegis creates an alert, e.g. '■■ 5 transactions in 2 minutes — possible SIM swap fraud.'
- Analyst review ■■■ — Compliance teams log into the dashboard to review alerts, investigate, and resolve them.

3. What the Team Will See (Final Product)

The dashboard provides a live transaction feed, a panel of fraud alerts ranked by severity, and detailed alert pages showing why the alert was triggered and suggested actions.

4. Real-World Benefits

- Fast response — suspicious payments caught in seconds, not hours.
- Reduced losses — prevent fraud before money leaves the system.
- Audit trail — every alert and action is recorded for compliance.
- Scalable — handles thousands of transactions per second.

5. Example: What a Bank Executive Would Hear

"When a suspicious transaction happens, Aegis will immediately flag it and notify your compliance team. Instead of finding out days later, you'll know within seconds, and your team can act before money is lost."
